

# ENERGY SAVING

An almost 2 weeks discussion has taken place at Copenhagen Summit on Global Warming which started on the 7th of December.

Global Warming is a cause on the increasing global temperature due to pollution.

Meanwhile, pollution is not necessarily caused by factories nor the industrial areas, yet regular households and offices can cause the same pollution and the same carbon print is emitted. In simple words anything or anyone that uses electricity and with it's over usage causes harm to our environment.

And since Global Warming is a vital issue that we need to participate on in part of the Green Council Concept and this is where Energy Saving comes as the important task globally.

## What is Energy Saving and how do we apply it?

Logically that even grade school students know what Energy Saving is. Through a simple explanation of Energy Saving, only switch the words as the last to be at the first and vice versa and you then will come up with the word " save energy".
